The obsolete package tocstyle*

Markus Kohm

2019/10/09

While the main classes of the KOMA-Script bundle were made, there where several ideas for formating the table of contents and lists of floats, but almost none of them where implemented. One reason was, that the KOMA-Script author didn't like to change the LATEX kernel at a class, because this may result in serveral problems with other packages. The package tocstyle will fill the gap. If it conflicts with another package, you simply may decide not to use it.

Since KOMA-Script 3.20 most of the features of tocstyle are also provided by other KOMA-Script packages like tocbasic.

1. Package Status

Package tocstyle has alpha status for a very long time (since 2007), despite the fact that it was very stable all over the years. The main reason for this is that it was an experiment and I always intended to make a better successor. Another reason was, that there are known issues, which are hardly to fix. So tocstyle never became an official part of KOMA-Script. Nevertheless it has been published with KOMA-Script, because I thought it would be an useful addition. I never thought that the interim status of the package would be for more than eight years.

With KOMA-Script 3.20 several features of tocstyle can be found also in tocbasic. I recommend to use that official and essential part of KOMA-Script instead of tocstyle whenever possible. Expect that tocstyle will

move from KOMA-Script bundle to another package, e.g., KOMA-Scriptobsolete or a stand-alone package soon.

2. How It Works

Loading the package tocstyle will redefine the kernel macro \@starttoc. Using the redefined \@starttoc will redefine \@dottedtocline, \l@part down to \l@subparagraph, \l@figure, and \l@table, if and only if tocstyle wasn't deactivated for all TOCs or this TOC. Usage the redefined \@dottedtocline will redefine \numberline.

Redefining \@starttoc, \@dottedtocline, and \numberline will activate the features of tocstyle for all lists that uses these, e.g. table of contents, list of figures and list of tables at the standard or the KOMA-Script classes. But while not all classes uses \@dottedtocline and \@numberline for all entries to table of contents and list of floats the package redefines some other macros that are typically used for those entries. These are e.g. \l@part, \l@chapter and some more. If the class even does not use those macros, you may not use tocstyle to change the lists. The term TOC will be used for all kind of list, that may be processed by tocstyle. The package tests wether the original kernel macros \@starttoc, \@dottedtocline, and \numberline were used or not and warns if not.

Package tocstyle needs some more information. For the standard and the KOMA-Script classes these informations may be detected by the package. If the result is not the expected, you may configure these informations manually.

The entries of every TOC hat a depth. See the counter tocdepth for more information about the depth. You may change several settings for the entries of either all depths of all TOCs, all depths of one TOC, or one depth of one TOC.

But most users will not need to set up tocstyle at this low level. They simply will select one of the predefined styles and maybe select one of the optional features.

3. Optional Features

Optional features will be selected using a package option while loading the package or using the package option as a global option loading the class using \documentclass. Optional features change generall behaviour of all TOCs.

tocindentauto tocindentmanual

With option tocindentauto all widths at the TOCs are calculated by tocstyle. The calculation of the width needs at least one LATEX run with all TOC entries. So you need at least three LATEX runs:

• one to write all the TOC entries to the TOC file

- one with the known TOC entries from the TOC file but unknown widths
- one with the known TOC entries from the TOC file and known widths

If the TOC entries changed between the second and the third run—e.g. because of page numbers changed—you'll need one more run (and so on).

Note: The widths of all entries of same depth and same TOC are same. Don't ask for less width of page numbers at the first than the last TOC page!

tocgraduated
 tocflat
tocfullflat

The option tocgraduated selects the graduated version of all TOCs. You know the graduated version from the standard classes. Entries of lower depth are indented against entries of higher depth. This may e.g. look like:

1.	Package Status	2
2.	How It Works	3
3.	Optional Features	3
4.	Using TOC Styles	6
5.	Setting-up Single Features	8

A. Examples for the Different TOC Styles	34
A.1. Graduated Versions	34
A.2. Flat Versions	40
A.3. Fullflat Versions	46

Default is option tocgraduated.

tocbreaksstrict tocbreakscareless Default option tocbreaksstrict sets a lot of penalties before and after TOC entries to avoid page break between a TOC entry and it's parent. But sometimes you may like to allow more page breaks. You may use option tocbreakscareless for this.

toctextentriesindented
toctextentriesleft

With default option toctextentriesleft unnumbered TOC entries, e.g. from KOMA-Script command \addchap, are indented only as wide as the number of numbered TOC entries of the same level are. But with option toctextentriesindented these are indented as if they have an empty number.

4. Using TOC Styles

\usetocstyle

Package tocstyle hat several predefined toc styles. Most users will never need to define their own toc style but only select one of the predefined and maybe configure it by one of the options described at the previsous section.

You may set the style of one or all TOCs. If you want to set the style of all TOCs, you'd simply say $\scalebox{usetocstyle}{\langle style \rangle}$. This will set all settings of the given style to all TOCs. Individual settings will overwrite this generall setting.

If you use $\sl = [\langle TOC \rangle] \{\langle style \rangle\}$, only the style of the given TOC will be set. This will be done *after* the general setting. Only individual settings of single features may overwrite the setting of the style.

The table 1 shows the predefined styles, that may be used as mandatory argument of \tocstyle. The optional argument $\langle TOC \rangle$ is the shortcut (file extension) of the TOC. Examples of known shortcuts are shown at table 2.

standard

A style similar to the standard classes. All width are predefined to the width of the standard classes, but may be overwritten by the general options (see section 3). The depth -1 (part) and 0 (chapter) are set in bold face (\bfseries). If no depth 0 was found at the TOC, depth 1 (section) will be set in bold face, too. All other depth will be set in normal font. Depth -1 (part) will be set using \large. The font changes are valid for the page numbers, too.

KOMAlike

A style similar to the KOMA-Script classes. This is almost the same like standard, but instead of bold face \usekomafont{disposition} will be used if \usekomafont was defined and sans serif, bold face (\sffamily\bfseries) if not.

classic

Like KOMAlike but all page numbers are set using normal font.

allwithdot

Like classic but dots between entry text and page numbers are used at all depths.

noonewithdot

Like classic but not dots between entry text and page numbers are used.

nopagecolumn

Like noonewithdot but also the gap between text and page numbers is omited. This means, that the page numbers are set 1 em after the text.

toc

Table of contents of almost all known classes.

lof

List of figures of almost all known classes.

lot

List of tables of almost all known classes.

101

List of listings of package listings. Currently the usability of listings with tocstyle is not recomended. Maybe it works, maybe not. Maybe you should try \deactivatetocstyle[lol].

\deactivatetocstyle \reactivatetocstyle Note: Before you're setting a style the style of the TOCs are unspecified. This means that some entries may be set using tocstyle others may not.

Both commands have one optional argument $\langle TOC \rangle$. You may deactive the influence of tocstyle for a TOC and reactivate it. If you use \deactivatetocstyle without the optional argument or empty optional argument, the influence of tocstyle for all TOCs will be deactivated and may reactivated only using \reactivatetocstyle without the optional argument or empty optional argument too.

After deactivation of tocstyle for one TOC or all TOCs you may continue configuring TOCs. All these changes will be used after reactivation.

5. Setting-up Single Features

At the previous section you've learned how to select a predefined TOC style. You were also told, that you may change one ore more features against the used predefined TOC style for one or all depth of one ore all TOCs. Now you will learn how to do this.

\settocfeature

These commands are used to set a single feature eiher of all depth of all TOCs (\settocfeature {\langle feature \rangle} {\langle command \rangle} \), or of all depth of a single TOC (\settocfeature [\langle TOC \rangle] {\langle feature \rangle} {\langle commands \rangle}), or of a single depth of all TOCs (\settocstylefeature [\langle depth \rangle] {\langle feature \rangle} {\langle commands \rangle}), or of a single depth of a single TOC (\settocfeature [\langle TOC \rangle] [\langle depth \rangle] [\langle depth \rangle] [\langle depth \rangle] {\langle feature \rangle} {\langle commands \rangle}).

Parameter $\langle commands \rangle$ is a list of commands. In most cases these must not be commands, that need an argument. So you should e.g. not use **\textbf** but **\bfseries** to switch to bold face. Parameter $\langle feature \rangle$ is the feature, that may be configured with parameter $\langle commands \rangle$. All known features are show at table 3.

The order of used commands for a feature is

Table 3: Features that May Be Set

dothook

will be executed before any dot of the dot line

entryhook

hook before the entry will be set

entryvskip

initial vertical skip amount (if not set 0pt plus .2pt will be used)

leaders

commands for fillin the gap between entry text and page number (if not set the default leaders command with dots will be used)

pagenumberbox

the box command for setting the page number (if not set the default box of with \@pnumwidth will be used); note, that this has to be a command with exactly one argument

pagenumberhook

hook before the page number will be set at the page number box parfillskip

add this amount to the default value of **\parfillskip** after setting up all lengths

raggedhook

the only allowed values here are \raggedright or nothing

${\tt space after number}$

amount of minimum space after the entry number, if the needed width will be calculated automaticly

- 1. commands for all depths of all TOCs,
- 2. commands for all depth of a single TOC,
- 3. commands for a single depth of all TOCs,
- 4. commands for a single depth of a single TOC,

and settings of \usetocstyle may be overwritten by \settocfeature und \settocstylefeature.

6. Defining New TOC Styles

Now you know how to select a prefedened TOC style and how to change single features. But wouldn't it be nice to define your own TOC style?

\newtocstyle

You may do this using $\newtocstyle[\langle parent\ style \rangle]$ [$\langle exclude\ features \rangle$] { $\langle style\ name \rangle$ } { $\langle settocstylefeature-commands \rangle$ }. If you used the optional argument $\langle parent\ style \rangle$ all features of the parent style will be part of the new style, before overwriting them with the features of the $\langle settocstylefeature-commands \rangle$. You should not use any other commands at the last argument. But at \newtocstylefeature to avoid to much mistakes.

The second optional argument is a comma seperated list of feature names. If it is used, these features of the parent style (and all ancestors of the parent) will not be part of the new style.

\aliastoc

Using $\aliastoc{\langle original-TOC\rangle}{\langle alias-TOC\rangle}$ you may define an alias for a TOC. The first argument is the original TOC for that the second argument should be the alias. An alias-TOC will be processed with all settings, that were done for the original-TOC. Internally this command is used as default for the optional, first argument of \showtoc .

7. Processing a TOC

While LATEX inputs a toc file it processes the commands of the TOC. These commands mainly produce the entries of the toc. Some commands are only available or valid while a TOC is processed. But be carefull: Some of these are read-only commands. Changing such a read-only command may result in various errors!

\@starttoc \showtoc The internal comand \@startoc is defined by the LATEX kernel. It is used by package and class authors to build commands like \tableofcontents or \listoffigures. Without using it you will not get a toc file. tocstyle redefines it, to add pre- and post-processing commands. The original definition found by tocstyle will be used inside the redefinition.

\showtoc [\langle preprocession \rangle] \{\langle TOC \rangle}\} is an addition of tocstyle. Using it will procude a copy of TOC and process this copy. The copy will be done just after creating the original TOC. The copy will be an alias for the original file. The extension of the copy is the generated alias if $\langle TOC \rangle$. You may generate the alias using \aliastoc at the optional argument of \showtoc. The default for this optional argument will be \aliastoc\tocstyleTOC\tocstyleAliasTOC and the default alias \tocstyleAliasTOC will be \tocstyleTOC extended by a number. The first TOC example at section 3 was made using

```
\showtoc[{%
  \aliastoc{\tocstyleTOC}{toc}%
  \usetocstyle[toc]{standard}%
  \settocfeature[toc]{raggedhook}{\raggedright}%
  \selecttocstyleoption{tocgraduated}%
}]{toc}
```

If you want to show a copy of the table of contents, that shows only depth 1 of the headlines you may simply use:

```
\showtoc[{%
   \expandafter\value{tocdepth}=1\relax
   \aliastoc{\tocstyleTOC}{toc}%
}]{toc}

or
   \newcounter{savedtocdepth}
   \setcounter{savedtocdepth}{\value{tocdepth}}
   \setcounter{tocdepth}{1}
   \showtoc{toc}
   \setcounter{tocdepth}{\value{savedtocdepth}}}
```

\tocstyleTOC \tocstyleAliasTOC These are read-only macros. While processing a TOC using \@starttoc or \showtoc, \tocstyleAliasTOC is the shortcut, that is valid for the features and \tocstyleTOC is valid for the file extension to be used.

\tocstyledepth

This is a read-only macro. While processing a single toc entry with <code>\@dottedtocline</code> this is the depth (first argument of <code>\@dottedtocline</code>) of this entry. Most users will never need this, but it is often used internaly. Because of this you should never change it!

\iftochasdepth

Using \iftochasdepth{ $\langle TOC \rangle$ }{ $\langle depth \rangle$ }{ $\langle true \rangle$ } { $\langle false \rangle$ } you may test, if an entry of a given depth was already output to a TOC. If so the commands of argument $\langle true \rangle$ will be processed. If not so the commands of argument $\langle false \rangle$ will be processed.

8. Configuration file

There's another feature for new toc styles. If there's a file tocstyle.cfg it will be loaded at the end of the package. This is usefull to define your

9. Implementation

    \PackageWarningNoLine{tocstyle}{%
86
      You should not use class option 'toc=flat'!\MessageBreak
87
      This may result in errors or unexpected results.\MessageBreak
88
      I'll try to deactivate 'toc=flat', now.\MessageBreak
89
      You may use package options 'tocflat' and Message Break
90
       'tocindentauto' instead of 'toc=flat'}%
    \csname @tocleftfalse\endcsname
92
93 \fi
```

9.2. Body

There are two parts at tocstyle:

- redefining internal LATEX kernel macros,
- defining new macros and redefining class macros.

Redefining LATEX kernel macros may not be switched of. But redefining class macros will only be on demand.

9.2.1. Redefining LATEX Kernel Macros

Some IATEX kernel macros must be redefined to add the new functionality. Before redefining them, we test against the definition at kernel 2005/12/01

```
\@starttoc
\tocstyle@saved@@starttoc
```

The original definition will be extended by defaults for \parskip, \parindent and \parfillskip and storage of the shortcut of the current TOC.

```
94 \newcommand*\tocstyle@saved@starttoc{}
95 \let\tocstyle@saved@starttoc\@starttoc
96 \renewcommand*{\@starttoc}[1]{%
    \tocstyle@pre@starttoc{#1}%
    \tocstyle@saved@starttoc{#1}%
98
99
     \tocstyle@post@starttoc{#1}%
100 }
```

\tocstyle@saved@dottedtocline For saving the unchanged definition (at \begindocument):

101 \newcommand*{\tocstyle@saved@dottedtocline}{}

```
\tocstyle@dottedtocline
                         Implement new definition and redefine:
                          102 \newcommand*{\tocstyle@dottedtocline}[5]{%
                               \let\numberline\tocstyle@numberline
                         103
                               \ifnum #1>\c@tocdepth \else
                         104
                          Penalty feature: no page break between higher and lower depths.
                                 \if@tocstyle@penalties
                         105
                         106
                                   \begingroup
                                     \@tempcnta 20010
                         107
                                     \advance \@tempcnta by -#1
                         108
                                     \ifnum \@tempcnta>\lastpenalty
                         109

Some classes do not use \numberline. This may result in negativ widths (esp. negativ skips). Following special handling of negativ values improves the toc handling of the standard classes. Nevertheless indentation of not numbered entries does not work with such classes!

```

              Defining a new TOC style. First optional argument is a TOC style, that
\newtocstyle
              will be activated before the new definitions. Note that all new definitions
              will overwirte the parent's definitions. So a new TOC style, that defines
              all features doesn't need a parent.
